

## Another Phase

August 7, 2020 and nothing has still been resolved with Covid 19. I came to the conclusion because of the Ebola flare up in West Africa a few years ago. That was another highly publicized quick spreading illness. I saw the world's nations and corporations come through in a matter of 2 or 3 months come up with a cure and got it out to the people. I have been involved in Electronic manufacturing for years. Mostly test engineering, where the temptation was to always over test a product. I think that with some of these drugs that they are pulling onto the market. The 1<sup>st</sup> world nations tends to be overly careful with drug testing. Being careful is wonderful and all in the normal case. A normal is where you have something like West Nile virus that does not affect large numbers. It also does not spread very quickly and you need an infected mosquito to bite you. Society has become overly cautious in my mind.

I am a believer act the way something is acting. I work in crisis management the information technology field. We have the maintenance crews. Maintenance crews consist of administrators, software management teams, and folks that push out updates so forth and so on. I believe that some of the administrative work should be done by Human Resources. The folks coming along are much more computer savvy than the folks in my generation. Got off track, then you have help line support and desktop support. These are the emergency line folks for when a system goes down hard or knowledge of how to use something. I do not believe that the FDA is working in the Emergency line mode. We have testing of the new drugs. If the first phase comes through with success. They should be real wide implementation real quick. The second phase should be short and you monitor the first phase for side effects. And you want to move forward with a rush not a fast walk. Science is good to a point but it is far from perfect. Science for it to be validity needs repeatability. Nature is always in chaos and does not repeat herself. The universe and the oceans are in chaos. In the oceans the cold water sinks to the bottom and the warm rises to the top and the fish and wild life stir things up. The phenomenon out in the universe are the same and it is the photons that stir things up. Here on the dry land we as humans are stirring things up.
